

We Can't Wait Anymore Where Are The Cures?

1 in 3 Americans Live With Chronic and/or Life Threatening Diseases.

The estimated economic impact of these diseases?

\$1,300,000,000,000.00 (trillions) and it continues to grow.

More than \$90,000,000,000.00 is spent per year on medical research and development.

But few new treatments emerge...

- In 2008 only 21 new drugs were approved by the FDA.
- That number is no greater than it was 50 years ago.

“The system for making new drugs is BROKEN.”

- Tell others about how the current system for medical research is broken and how it fails in delivering patient treatments.
- Visit WhereAreTheCures.org to learn more about the research system and to Sign the Patient's Manifesto.
- Let your voice be heard and join others who care to make creating more treatments faster for all patients a priority, whatever the disease.

THE PATIENT'S MANIFESTO:

- I believe the system for funding and conducting medical research and developing new patient treatments is broken.
- I believe that patients are not getting an adequate return on the billions of government, non-profit and industry dollars being spent on the research and development of new patient treatments
- I believe that academic scientists, government funding and regulatory agencies, non-profit disease research foundations, commercial biotech and pharmaceutical companies, and entrepreneurs should aggressively seek new ways to accelerate the pace of medical research and the development of new patient treatments for the billions living with diseases who can't afford to wait.

Be a Part of the Solution. Sign the Patient's Manifesto today!
